                                                                                                      12-JUL-1996
                                                                                                                           R93977;
                                                                                                                                              R93977 standard;
                                                                                                                                                                                                                                                                                                           This sequence represents the human vascular permeability factor (hVPF). The monoclonal antibody of the invention (MVI01) reacts with this hVPF sequence. MVI01 does not, however, react with a peptide composed of ten sequence residues of this sequence starting from an odd number from the V-terminus of this sequence (e.g. residues 1-10, residues 5-14, residues 47-56 etc.). The antibody can be used for diagnosis and treatment of cancer and other diseases. When it is used as an anti-cancer agent, it is preferably in the form of a chimeric or humanised antibody.

                                 The patent discloses a vascularisation-controlling vaccine comprising a cell growth factor which specifically promotes growth of endothelial cells. The vaccine is typically used in immunotherapy to remedy diseases caused by vascularisation, such as solid tumours, and to control the onset and recurrence of such diseases. Typical growth factors include vascular permeability factor (VPF) and vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents VPF121. The patent relates to three new short peptides derived from this sequence (see R93978 - R93980) to monoclonal antibodies raised against them which are useful as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Partial peptide(s) of VPF121 and monoclonal antibodies - anticancer agents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           WPI;
                                                                                                                                  Vascularisation-controlling vaccine - contains endothelial cell growth factor, used in the immunotherapy of solid tumours
                                                                                                                                                                                                                                               31-MAY-1996;

                                                                                                                                                                                                        Vascular endothelial growth factor; VEGF145; anglogenic factor; cell proliferation; cardiovascular disease; drug permeation. tumour.
                                                                                                                                                                                                                                        Vascular endothelial growth factor-145 (VEGF145).
                                                                                                                                                                                                                                                                  24-JUL-1998
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39,7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). Y08278-Y08301 are human growth factor protein fragments used in the method of the invention.
                                                                                                                                                                                                                                                                                                         W56693 standard; Protein; 145
                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This represents a vascular endothelial growth factor-145 (VEGF145) which CC can be used to stimulate vascular cell proliferation. Polynucleotides cell encoding VEGF145 are useful for treatment of cardiovascular or vascular cell growth factor of cardiovascular cell growth for enhancing control of the proliferation of the proliferation of the stimulate cell growth of the proliferation of the enhance endothelialization of diseased control of the proliferation of the enhance endothelialization of diseased control of the proliferation of the partin binds much better compared to the proliferation after angioplasty in mammals. CC vegF145, which binds as weakly as VegF165 to beparin, binds much better compared to the producer cells and binds efficiently to ECM. CC This combination of properties render VEGF145 the only known VEGF variant that is secreted from producing cells retaining at the same time ECM carget blood vessels, while some of the produced VEGF145 will be retained by ECM components along the path of diffusion. This ECM bound pool will consiste slowly allowing a longer period of activity. Additionally, the biological activity of VEGF145 is protected against oxidative damage unlike VEGF forms such as VEGF121 thereby giving it a longer half-life.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7%, in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). Y08278-Y08301 are human growth factor protein fragments used in the method of the invention.
                                                                                                           Novel methods and compositions for the prevention and treatment microvascular angiopathies by administration of angiogenic factor as vascular endothelial growth factor (VEGF) - ^{\circ}
The present sequence represents native human vascular endothelial growth factor (VEGF) 145. VEGF is an angiogenic factor. VEGF proteins are used for the prevention or repair of injury to blood vessels or associated nonvascular tissues (served by the blood vessels) and for the prevention
                                                                                                                                                                                                                                                                                                                                                     09-SEP-1999;
                                                                                                                                                                                                                                                                                                                                                                                    16-MAR-2000

The proteins methods may also be used for the prevention and treatment of kidney diseases associated with injury to, or atrophy of, the vasculature of the glomerulus and interstitium. Conditions which may be treated include haemolytic uremic syndrome, toxic shock syndrome, venom exposure, chemical exposure, preclampsia, thrombotic thrombocytopenia purpura, disseminated intravascular coagulation, sechemic bowel disease, transient ischemic attacks, stroke, hypoxia or hypercappia or fibrosis arising from lung endothelium injury, acute respiratory distress syndrome, toxic alveolar injury, pneumonia, pulmonary emboli, birth prematurity diseases, organ transient format organizate formations, hypersensitivity, autoimmune diseases, organ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Matches

Administering vascular endothelial growth factor (VGEF) can be for treating hypertension (especially salt-dependent hypertensis Administration of VGEF promotes angiogenesis and/or vascular or capillary permeability. The method is also useful in treating disorders related to abnormal transport of solutes across endot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Vascular endothelial growth factor; human; anglogenesis; VGEF; capillary formation; hypertension; treatment; kidney; CNS; stroke; meningitis; central nervous system; tumour; infection; bone growth; hypoxia; hypercapnia; fibrosis; inflammatory bowel disease; diarrhoea; allografts; cardiac valve.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cc cells. Such disorders include the treatment or prevention of kidney cd disease associated with impaired filtration or excretion of solutes; the treatment or prevention of diseases of the central nervous system cassociated with alterations in cerebrospinal fluid, e.g. stroke, cmeningitis, tumous, infections, and bone growth disorders; treatment or prevention of fluid secretions in the lungs, e.g. acute respiratory distress syndrome, toxic alveolar injury, pneumonia, infections, custic fibrosis; treatment or prevention of customers toxic alveolar injury, pneumonia, infections, custic fibrosis; treatment or prevention of guinonary dysfunction arising from injury to the pulmonary dysfunction arising from prevention of disease arising cultimonary hypertension; treatment or prevention of disease arising crom disordered transport of fluid and solutes across the intestinal customers arising from prevention of disease arising crom disordered transport of fluid and solutes across the intestinal customers of solute flux; preservation or enhancement of customers of solute flux; preservation or enhancement of function of corgan allografts; and treatment of cardiac valve disease. This sequence is the native human vascular endothelial growth customers arising customers arising customers allografts. The activity of VGEF is mediated by interaction customers conditions of the vascular endothelial growth customers arising customers arising conditions of the vascular solutions.
                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Bovine folliculo stellate cells were used in the process of cottaining cDNA encoding bVEGF (164 amino acids from). The probes represented in Q10806 and -07 were used in the screening procedures. See Q10796 for bVEGF120 which is obtained by alternative splicing of this sequence, i.e. bases 342-473 (amino acids 115-159) are spliced. The product can be used for anyiogenesis and re-endothelialisation of inner vascular surfaces in wound healing, e.g. treatment of full-culters, burns, in surgery, in balloon angioplasty and for the in culturing of endothelial cells. Hybrid growth factors of pDGF can be used for wound healing or anyiogenesis for can be used for vound healing or as inhibitors of angiogenesis for ce.g. preventing the growth of tumours.

CC eg. preventing the growth of tumours.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence of Q44259 contains an open reading frame corresponding to the 164 amino acid bovine vascular endothelial cell growth factor (bVEGF-164, i.e. R38920). Alternative splicing of the sequence gives a shorter coding sequence which encodes the 120 amino acid bVEGF (see R38916).

```

The sequence of Q44260 contains an open reading frame corresponding to the 165 amino acid human vascular endothelial cell growth factor (hVEGF-165, see R38921). Alternative splicing of the sequence gives a shorter coding sequence which encodes the 121 amino acid hVEGF (see R42607). The full-length coding sequences can be generated using PCR with human foetal vascular smooth muscle poly-A+ RNA as template.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches
                                                                                                                                                                                                                                                                                                            02-AUG-1996;
25-AUG-1995;
05-DEC-1995;
W31085-W31096 are vascular endothelial growth factor (VEGF) variants. Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.
                                                                                                                                                                          Vascular endothelial cell growth factor variant - used candidates having agonistic or antagonistic properties to KDR and/or FLT receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      substitution; drug screening; kinase domain binding FMS-like tyrosine kinase binding region; FLT-1; dritesting; vasculogenesis; anglogenesis; metastasis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     N.B.
from
W31085-W31096 are vascular endothelial growth factor (VEGF) variants Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FIJP-1). All indicated residues are preferably replaced with alanne. TWE variants may be used in an assay for identifying candidate compositions having agonistic antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants
                                                                                                                                                                                                                                                                  Vascular endothelial cell growth factor variant - used candidates having agonistic or antagonistic properties to KDR and/or FLT receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Location/Qualifiers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        KDR and/or FIT-1 receptors. Compositions identified may be for treating indications where vasculogenesis or angiogenesis ired for treatment of an underlying disease state. This sequence is not given in the specification, it was created claimed specified mutant of wild-type mature VEGF.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  C w31085-w31096 are vascular endothelial growth factor (VEGF) variants.
C Especially preferred modifications comprise mutations in the kinase domain binding region (RDR) or the FMS-like tyrosine kinase binding region (FUT-1). All indicated residues are preferably replaced with calanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties of with respect to KDR and/or FLT receptor binding, by measuring the ceffect the candidate has on the binding properties of the variants of the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis cuseful for treating indications where vasculogenesis or angiogenesis of the desired for treatment of an underlying disease state.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or anglogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                                                                                                                                                                                                                                                                                                           substitution; drug screening; kinase domain binding region; KDR; FMS-like tyrosine kinase binding region; FLT-1; drug screening; Festing; vasculogenesis; angiogenesis; metastasis; cancer; tumou

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            w31085-w31096 are vascular endothelial growth factor (VEGF) variants. Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLDT-1). All indicated residues are preferably replaced with calanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT-1 receptors binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             δÃ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        W31085-W31096 are vascular endothelial growth factor (VEGF) variants.

C Especially preferred modifications comprise mutations in the kinase of domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FUT-1). All indicated residues are preferably replaced with a lanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FUT receptor binding, by measuring the ceffect the candidate has on the binding properties of the variants to the KDR and/or FUT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis of is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FIT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FIT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                02-AUG-1996;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1): All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
                                                                                 VEGF; vascular endothelial growth factor; variant; mutant; substitution; drug screening; kinase domain binding region; KDR; FMS-like tyrosine kinase binding region; FIT-1; drug screening; testing; vasculogenesis; angiogenesis; metastasis; cancer; tumou;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial cell growth factor variant - used candidates having agonistic or antagonistic properties to KDR and/or FLT receptor binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cunningham BC, Ferrara Wells JA;

                                                                                                                                                                                                                                                                                                                                                                                                            Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.
            Synthetic.

Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with alanine. The variants may be used in an assay for identifying candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.
                                                                                                                        Vascular endothelial growth factor variant used

```
Especially preferred modifications comprise mutations in the kinase domain binding region (KDR) or the FMS-like tyrosine kinase binding region (KDR) or the FMS-like tyrosine kinase binding region (FLT-1). All indicated residues are preferably replaced with candidate compositions having agonistic or antagonistic properties with respect to KDR and/or FLT receptor binding, by measuring the effect the candidate has on the binding properties of the variants to the KDR and/or FLT-1 receptors. Compositions identified may be useful for treating indications where vasculogenesis or angiogenesis is desired for treatment of an underlying disease state.

N.B. This sequence is not given in the specification, it was created from a claimed specified mutant of wild-type mature VEGF.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                  Mutant
                                                                                                                                                                                                                                                                                                                                Receptor protein tyrosine kinase assays can be used to identify inhibitors of receptor tyrosine kinases which can be utilised for inhibiting vascular permeability or for preventing angiogenesis e.g. in tumour therapy; or the assays can be used to induce vascular permeability or to enhance angiogenic activity, e.g., in wound healing. This mutant vascular endothelial growth factor comprises a K73S substitution and was identified in an assay involving the receptor protein neuroepithelial tyrosine kinase (NYK). It is a receptor agonist.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Receptor protein tyrosine kinase assays can be used to identify inhibitors of receptor tyrosine kinases which can be utilised for inhibiting vascular permeability or for preventing angiogenesis e.g in tumour therapy; or the assays can be used to identify activators of receptor tyrosine kinases which can be used to induce vascular permeability or to enhance angiogenic activity, e.g., in wound healing. This mutant vascular endothelial growth factor comprises an HillG substitution and was identified in an assay involving the receptor protein neuroepithelial tyrosine kinase (NYK). It is a receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 33;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New receptor protein tyrosine kinase assays inhibitors or activators which can be used angiogenesis or vascular permeability

This mutant vascular endothelial growth factor comprises a G117V substitution and was identified in an assay involving the receptor protein neuroepithelial tyrosine kinase (NYK). It is a receptor agonist.

Multiple cDNAs encoding alternative forms of the VEGF A-subunit were amplified using PCR primers as in Q23049 and Q23050. Three sets of clones were identified. Clone #12 encoded the 164 amino acid secreted form of VEGF A-subunit (see R23347). Clone #14 has a 135 bp deletion and thus encodes a 120 amino acid form and Clone #16 has a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       R22348 standard; Protein; 146
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Receptor protein tyrosine kinase assays can be used to identify inhibitors of receptor tyrosine kinases which can be utilised for inhibiting vascular permeability or for preventing angiogenesis e.g in tumour therapy; or the assays can be used to identify activators of receptor tyrosine kinases which can be used to induce vascular permeability or to enhance anylogenic activity, comprises the following substitutions: K109R, P110S, H111G, O112D, S113R, O114P and H115S. It was designated VEGFO and was identified in an assay involving the receptor protein neuroepithelial tyrosine kinase (NYK). It is a receptor agonist.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 27

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  72bp insertion and encodes a 188 amino acid mature protein (R22351). The deleted region lies between the second base of the Asn140 codon and the third base of the Arg184 codon. The 120 amino acid mature protein has Asn140 converted to Lys140. See also Q23038-Q23059.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a rat vascular endothelial growth factor II (VEGF II) A subunit variant with a conversion of Asn 140 to Lys 140, and the deletion of His 141 to Arg 184 from the wild-type given in w53639. The present invention describes: (1) a mammalian VEGF II protein comprising an A subunit from w53639, w53640 or w53641, and a B subunit from w53638, w53639 or the first 115-135 amino acids of w53638; and (2) a mammalian VEGF comprising a heterodimer or homodimer of B subunits. The growth factor is used for promoting vascular development and repair and for promoting tissue repair.

N.B. The present sequence is not given inthe specification but is derived from Fig 5 as stated in the claim.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; Page -; 46pp;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vascular endothelial cell growth factor; VEGF II; rat; glioma mitogenesis; blood vessel growth; artificial blood vessel.

```
This is the amino acid sequence of a 146 amino acid residue A subunit of vascular endothelial cell growth factor (VEGF). The invention relates to a purified and isolated VEGF C subunit amino acid sequence Y57025. VEGF exists in various microheterogenous forms, and is useful for the promotion of vascular development and repair. The invention also relates to human VEGF heterodimers AC or BC and homodimer CC, where A, B and C are subunit amino acid sequences. The VEGF AC, BC or CC amino acid sequences can be used in a tissue repairing pharmaceutical composition. The novel growth factors are useful for the production or coverage of artificial blood vessels with vascular endothelial cell. They are also useful for the induction of tissue growth and repair.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          VEGF; vascular endothelial growth vascular development; artificial b

It allows vascular explants to be grown on a GDGF treated surface for implantation in a host. The sequence was isolated from the GS-9L rat cells.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         8888888
                    The full length coding region of the A subunit or monomer of VEGF oligo. primers based on the amino acid sequences
C ple-Met-Asp-Val-Tyr-Gln from polypeptide L42 (residues 42-47) and CCys-Lys-Asn-Thr-Asp from polypeptide T38 (residues 164-168) were used to PCR amplify the central region of the cDNA for VEGF A chain.
C1 igated into pGEM3Zf(+) and sequenced. The nucleotide sequence obtained (p4238) was used to design antisense and sense PCR primers to amplify the 5 and 3 ends of the CDNA. These 5' and 3' clones coding the 164 amino acid secreted form identified by protein ccc and a 214 amino acid forms are cloned and sequenced.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence of vascular endothelial cell growth factor VEGF 190 amino acid residue subunit.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             were isolated and sequenced using the Edman degradation reaction in a gas phase sequenator. In addition to the peptide fragments which were directly sequenced, the full-length protein sequence was deduced from the cDNA encoding it.
                                                                                                                                                                                                                        Disclosure;

CC GS-9L cells were cultured and the VEGF AB subunits were isolated CC and sequenced. The reduced and carboxymethylated protein eluted CC as two peaks at approx. 23 and 25 ml that were of approx. equal CC area as determined by monitoring absorbance at 210 nm. Samples CC of the two protien subunitis isolated after reduction and CC carboxymethylation were each applied to polybrene-coated glass (fiber filters and their N-terminal sequences were determined. CC The peak of absorbance eluting at approx 25 ml (A subunit) yielded CC an amino terminal sequence Ala Pro Thr Glu Gly Glu Glu Lys Ala His CC an amino terminal sequence Ala Pro Thr Glu Beak of absorbance eluting CC at approx. 23 ml (B subunit) yielded the N-terminal sequence Ala CC at approx. 23 ml (B subunit) yielded the N-terminal sequence Ala CC Glu Val Val I val To Ala Ser Thr Glu Met Glu Val Val Pro Phe Asn CC Glu Val Plus a nearly equal amount of a truncated form of the same sequence missing the first three residues. The missing X residue corresp. to an Asn in the cloned sequence. The missing X residue B chain peptides were recovered in nearly equal amounts supporting the interpretation that the two peptides combine to form an AB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RESULT 15

The form of VEGF AB mature A subunit in the heterodimer is the 164 amino acid form. The form of VEGF AB mature J subunit in the heterodimer is the 13 amino acid form derived from the 158 full length amino acid form.
